

*Annual Drinking Water Quality Report
City of Seaford, Delaware
302 East King Street
PWSID# DE0000246
April 21, 2004*

We're pleased to present to you this year's Annual Quality Water Report. This report is designed to inform you about the quality water and services we deliver to you every day. Our constant goal is to provide you with a safe and dependable supply of drinking water. We want you to understand the efforts we make to continually improve the water treatment process and protect our water resources. We are committed to ensuring the quality of your water. **Our water source is groundwater. Our five wells draw from the Columbia Aquifer. Before the water is delivered to you, we add hypochlorite as a disinfectant to protect against microbial contaminants and soda ash to adjust the ph to a neutral level. Also, we have started adding fluoride to help prevent tooth decay**

The Division of Public Health in conjunction with the Department of Natural Resources and Environmental Control has conducted a source water assessment. If you are interested in reviewing this assessment, please contact **City Hall @ 629-9173** regarding its availability and how to obtain a copy.

I'm pleased to report that our drinking water meets federal and state requirements.

If you have any questions about this report or concerning your water utility, please contact **the Public Works Superintendent, @ 302-629-8307 or 302-629-9173**. We want our valued customers to be informed about their water utility. Should you have any concerns with the City of Seaford's drinking water quality the Mayor and Council meet on the **second and fourth Tuesday of each month at 7:00 pm at the City Hall Annex, High Street**. Please contact **Dolores Slatcher, City Manager @ 302-629-9173** no later than Thursday prior to the regularly scheduled meeting to be placed on the agenda.

Public Health, Office of Drinking Water and the City of Seaford Water Department routinely monitor for constituents in your drinking water according to Federal and State laws. This table shows the results of our monitoring for the period of January 1st to December 31st, **2003**. As water travels over the land or underground, it can pick up substances or contaminants such as microbes, inorganic and organic chemicals, and radioactive substances. All drinking water, including bottled drinking water, may be reasonably expected to contain at least small amounts of some constituents. It's important to remember that the presence of these constituents does not necessarily pose a health risk.

In this table you will find many terms and abbreviations you might not be familiar with. To help you better understand these terms we've provided the following definitions:

Non-Detects (ND) - laboratory analysis indicates that the constituent is not present.

Parts per million (ppm) or Milligrams per liter (mg/l) - one part per million corresponds to one minute in two years or a single penny in \$10,000.

Parts per billion (ppb) or Micrograms per liter - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

Action Level - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Treatment Technique (TT) - A treatment technique is a required process intended to reduce the level of a contaminant in drinking water.

Maximum Contaminant Level (MCL) - The “Maximum Allowed” (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) - The “Goal”(MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

TEST RESULTS						
Contaminant	Violation Y/N	Level Detected	Unit Measurement	MCLG	MCL	Likely Source of Contamination
Microbiological Contaminants						
1. Total Coliform Bacteria	N	1 * present	Presence/Absence	0	presence of coliform bacteria in 5% of monthly samples	Naturally present in the environment
* 1 sample out of nine taken came back present in August. All resamples and follow-up samples came back absent; the reason may have been a bad sample tap.						
Inorganic Contaminants						
8. Antimony	N	0.1	ppb	6	6	Discharge from petroleum refineries; fire retardants; ceramics; electronics; solder
9. Arsenic	N	0.1-0.7	ppb	n/a	50	Erosion of natural deposits; runoff from orchards; runoff from glass and electronics production wastes
11. Barium	N	0.1078-0.2484	ppm	2	2	Discharge of drilling wastes; discharge from metal refineries; erosion of natural deposits
12. Beryllium	N	0.2-0.5	ppb	4	4	Discharge from metal refineries and coal-burning factories; discharge from electrical, aerospace, and defense industries
13. Cadmium	N	0.2	ppb	5	5	Corrosion of galvanized pipes; erosion of natural deposits; discharge from metal refineries; runoff from waste batteries and paints
14. Chromium	N	0.8-1.0	ppb	100	100	Discharge from steel and pulp mills; erosion of natural deposits
15. Copper	N	0.132*	ppm	1.3	AL=1.3	Corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives
17. Fluoride	N	0.43-0.83	ppm	0.8 -1.2	1.8	Erosion of natural deposits; water additive which promotes strong teeth; discharge from fertilizer and aluminum factories.

Inorganic Contaminants						
18. Lead	N	3	ppb	0	AL=15	Corrosion of household plumbing systems, erosion of natural deposits
20. Nitrate (as Nitrogen)	N	7.1-7.8	ppm	10	10	Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural deposits
22. Selenium	N	0.5-3.7	ppb	50	50	Discharge from petroleum and metal refineries; erosion of natural deposits; discharge from mines
23. Thallium	N	0.1-0.3	ppb	0.5	2	Leaching from ore-processing sites; discharge from electronics, glass, and drug factories
Nickel	N	1.6-10.8	ppb	n/a	100	Naturally occurring
*1 sample out of 20 samples collected exceeded the AL for copper with a result of 1.35ppm.						
Synthetic Organic Contaminants including Pesticides and Herbicides						
27. Alachlor	N	0.41-0.73**	ppb	0	2	Runoff from herbicide used on row crops
Volatile Organic Contaminants						
56. Benzene	N	0.2**	ppb	0	5	Discharge from factories; leaching from gas storage tanks and landfills
**represents 2001 reporting: The state allows us to monitor for some contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of our data, though representative, are more than 1 year old.						
Unregulated Inorganic Contaminants						
79. Iron (Fe)	N	0.31	ppm	0	0.3	
80. Sodium (Na)	N	24-41	ppm	0		
81. Alkalinity (Alk)	N	30-68	ppm			
82. pH	N	6.7-7.0	ppm		6.5 – 8.5	
83. Chloride (Cl)	N	11-15.1	ppm		250	
84. Hardness	N	13-21	ppm			
85. Total Dissolved Solids (TDS)	N	120-146	ppm		500	
90. Sulfate	N	3.7-4.8	ppm			
75. TTHM [Total trihalomethanes]	N	3.05	ppb	0	100	By-product of drinking water chlorination

*** All other contaminants were ND in compliance with the Safe Drinking Water Act.**

Nitrate in drinking water at levels above 10 ppm is a health risk for infants of less than six months of age. High nitrate levels in drinking water can cause blue baby syndrome. Nitrate levels may rise quickly for short periods of time because of rainfall or agricultural activity. If you are caring for an infant you should ask advice from your health care provider.

As you can see by the table, our system had no violations. We're proud that your drinking water meets or exceeds all Federal and State requirements. We have learned through our monitoring and testing that some constituents have been detected. The EPA has determined that your water is drinkable at these levels.

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. In order to insure tap water is safe to drink, EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration regulations established limits for contaminants in bottled water, which must provide the same protection for public health.

All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1-800-426-4791.

MCL's are set at very stringent levels. To understand the possible health effects described for many regulated constituents, a person would have to drink 2 liters of water every day at the MCL level for a lifetime to have a one-in-a-million chance of having the described health effect.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

Please call our office if you have questions.

We at the City of Seaford work around the clock to provide top quality water to every tap. We ask that all our customers help us protect our water sources, which are the heart of our community, our way of life and our children's future.
